

InClass Assignment 6

Project Architecture & Component Generation

Component Architecture (Component Splitting)

Objective: Master basic project layout and component decomposition by generating the two core application views and rendering them within the root view layout.

Part 1: Generate the Core Structural Components

Open your secondary terminal and generate two new standalone components to represent the data input view and the live data feed view:

```
ng generate component data-form
ng generate component data-list
```

Part 2: Register Components in the Application Root

Open `src/app/app.ts`. Import `DataFormComponent` and `DataListComponent` from their respective directories. Add both classes into the root component's metadata `imports: [...]` array:

```
import { Component } from '@angular/core';
import { DataFormComponent } from './data-form/data-form.component';
import { DataListComponent } from './data-list/data-list.component';

@Component({
  selector: 'app-root',
  standalone: true,
  imports: [DataFormComponent, DataListComponent],
  templateUrl: './app.html',
  styleUrls: ['./app.css']
})
```

```
})  
export class AppComponent {  
  title = 'Angular Beginner Assignment';  
}
```

Part 3: Mount Layout Selectors in Root Template

Open `src/app/app.html`. Wipe out any default Angular welcome markup and arrange the two custom element selectors within a structured container layout:

```
<main style="padding: 30px; font-family: system-ui, sans-serif; max-width: 600px; margin: 0 auto;">  
  <h1 style="color: #333; text-align: center;">Data Management Dashboard</h1>  
  <hr style="border: 0; border-top: 1px solid #eee; margin: 20px 0;">  
  
  <div style="margin-bottom: 25px;">  
    <app-data-form></app-data-form>  
  </div>  
  
  <div style="margin-bottom: 25px;">  
    <app-data-list></app-data-list>  
  </div>  
</main>
```

Part 4: Add Placeholder View Text

Open `src/app/data-form/data-form.html` and confirm its creation with a quick placeholder heading:

```
<div style="padding: 15px; border: 1px dashed #ccc; border-radius: 6px;">  
  <p style="margin: 0; color: #777;">Data Entry Form Component Loading...</p>  
</div>
```

Open `src/app/data-list/data-list.html` and do the same:

```
<div style="padding: 15px; border: 1px dashed #ccc; border-radius: 6px;">
  <p style="margin: 0; color: #777;">Data Feed Display Component
  Loading...</p>
</div>
```

Part 5: Submission

Verify that your local dev server builds successfully. Submit all modified files across the `src/app/` root directory, `data-form`, and `data-list` directories.
