

InClass Assignment 2

Dynamic Data & Interpolation

Objective: Learn to declare component state (properties) in the TypeScript class and render them dynamically in the HTML template using structural interpolation.

Part 1: Defining the Product Model & State

Open `src/app/product-list/product-list.ts`. Inside the component class, declare three distinct properties to represent a featured product:

```
productName: string = 'Wireless Mechanical Keyboard';  
productPrice: number = 129.99;  
inStock: boolean = true;
```

Binding State to the Template

Open `src/app/product-list/product-list.html`. Replace the static text with dynamic bindings:

```
<div style="padding: 20px; border: 1px solid #ddd; margin-top: 15px;">  
  <h2>Available Items</h2>  
  <div style="border: 1px solid #eee; padding: 15px; border-radius: 5px;">  
    <h3>{{ productName }}</h3>  
    <p>Price: ${{ productPrice }}</p>  
    <p>Status: {{ inStock ? 'In Stock' : 'Out of Stock' }}</p>  
  </div>  
</div>
```

Submission

Submit the updated `product-list.ts` and `product-list.html`.
