

Assignment 1 (Graded)

Graded Assignment: Full-Stack React Application

Submission Deadline: Monday, June 8 (After Class)

Objective

To build a 3-page React frontend application that communicates with a custom Node.js/Express backend, persistently storing and retrieving data using the native mongodb driver.

Project Requirements

1. Frontend (React)

You must implement a multi-page React application using React Router. The application must include the following three pages:

- **Home Page (/):**
 - Create a visually appealing landing page.
 - Include a reusable component (e.g., a "Welcome Card" or "Feature Highlight") that accepts and displays content passed in via **props**.
- **User Info Page (/userinfo):**
 - Create a form component designed to collect user information (e.g., Name, Email, Role).

- Upon submission, the form must send this data via a POST request to your Node.js backend.
- **User List Page (/userlist):**
 - Create a list component that fetches the saved user data from your Node.js backend via a GET request.
 - Display each retrieved user record clearly in a list format.

2. Backend (Node.js & Express)

- Create a RESTful API to handle the frontend's POST and GET requests.
- **Database Integration:** You must connect your server to MongoDB using the **native mongodb package**.

3. Code Quality & Architecture

Maintain the professional standards we practice in class:

- **Folder Structure:** Keep your code modular. Separate your React files logically.

Plaintext

```
src/
├── components/    # Reusable UI components (Form, List, Prop-based Home compone
├── pages/         # Page layouts (Home, UserInfo, UserList)
├── App.js         # Routing configuration
└── index.js
```

- **Documentation:** Your code must be thoroughly commented. Explain the purpose of your components, props, state management, and API calls.
- **Clean Code:** Ensure proper indentation, meaningful variable names, and removal of unused boilerplate code.

Submission Guidelines

1. Set `client` (React) folders into a single folder.
2. **CRITICAL:** remove the `node_modules` folders and the `package-lock.json` files from the frontend folder before compressing.
3. Zip the folder and submit the `.zip` file via the designated portal.
